

Tips on waste reduction before landfill fills up

Letter to the Editor / The Valley Springs News / August 31, 2022

Editor:

We have about two years before our Calaveras County landfill reaches capacity. So now is the time to reduce waste! Here are three ways to reduce landfill waste: 1) recycle, 2) compost, and 3) avoid trash in the first place.

Recycling saves resources, energy, and sacrce landfill space. So keep a recycle bin next to your trash can. You can even get your CRV deposit back on bottles (and treat yourself to something!).

Nearly 20 percent of garbage is food waste, which is actually one of the worst things to throw away. This is because organic waste in landfills produces a lot of methane, which warms our planet over 20 times as much as carbon dioxide. Instead, compost your food waste and turn it into rich nutrients for your garden. Many composting styles exist and some are truly quite easy. Visit www.calaverascap.com and click "CAP Climate" for resources.

Most importantly, avoid new trash whenever you can. Provide your own reusable shopping bags and mugs for coffee. Throw a container in your car for restaurant leftovers. Shop at farmers' market, because it usually means little to no waste plus boosts the local economy. Shopping online? Wait and buy more than one item when possible to reduce packing materials.

The less you do to help, the more the burden will fall on our government, and the more taxes we'll have to pay.
